Resolved Defects

1. Looping approvals for multiple groups assigned to a job

What was the issue:
When multiple principal groups were assigned to a job, users who had already approved their service lines were sometimes required to approve them again, causing an approval loop.

Fix and Benefit:
The issue has been resolved so that each user only needs to approve their service line once, streamlining the approval process.

2. Second level approval job status

What was the issue:
When multiple groups were assigned to a job, and one group raised a query on a service line, the job status changed to "queried" for all groups. This prevented other users who hadn't raised the query from taking any further action on their service lines.

Fix and Benefit
The system now allows other assigned groups to continue approving their service lines even if a query has been raised by another group. This helps avoid unnecessary delays and speeds up the DA approval process.
