Features
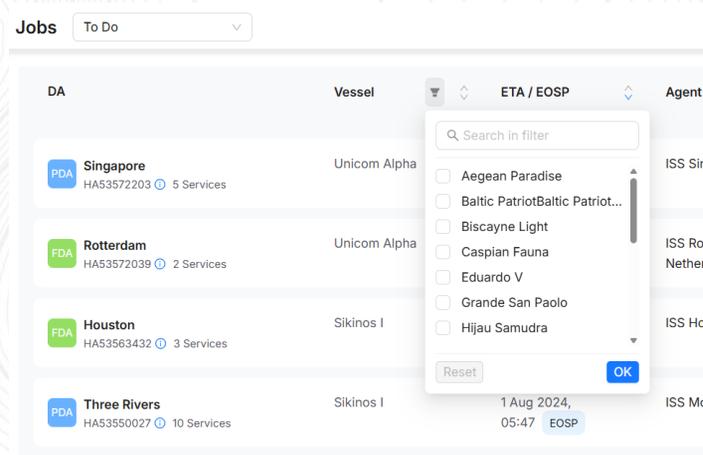

1. Column filters on jobs page

What was the issue:
The jobs page consisted of only three options to filter on all jobs, increasing the time and effort to search for a specific job.

Fix and Benefit:
Additional filtering has been added to the Vessel, Agent, Operator and Status columns, allowing you to easily find the job you are looking for.
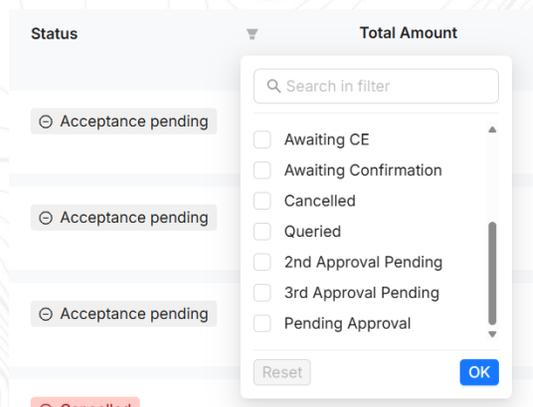

2. Multi-level approval status icons

What was the issue:
Previously, when viewing the jobs page, there was no way to filter or view jobs based on the approval stage of a job.

Fix and Benefit:
New status icons have been added to show what level of approval a job is at, if it requires multiple levels of approval. These icons are also linked to the new status filter, so that you can filter jobs based on their current approval stage.
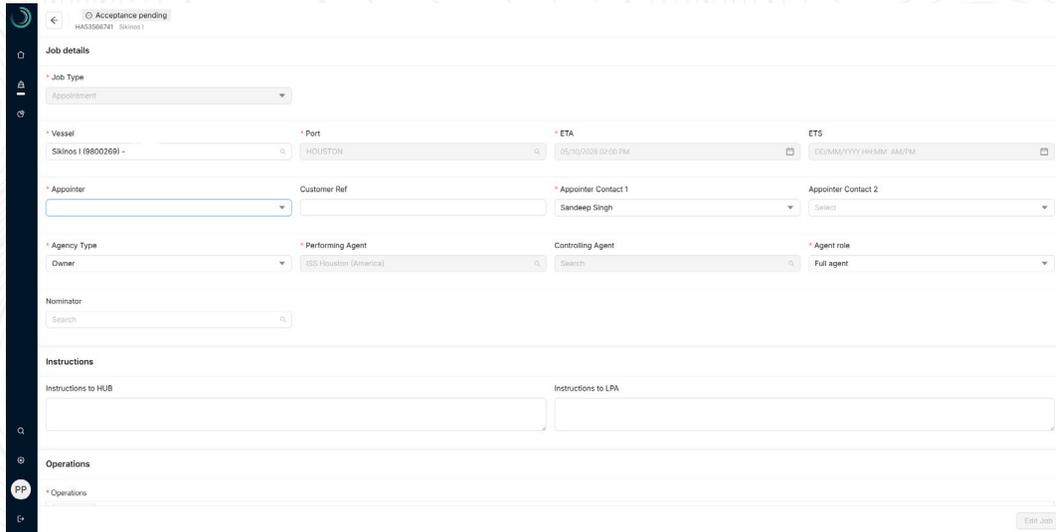

3. Edit job details

What was the issue:
There was no way for you to edit the job details after a job had been created, requiring intervention from the Hub team to make updates to the job details.

Fix and Benefit:
Job detail fields are now editable for you after the job has been created, allowing you to make any changes to the job details before it reaches the PDA stage.

Improvements

1. Increased size of search pop up

What was the issue:
Previously the search function would open within a small pop up, this would hide some of the columns of the search and you would need to scroll to view all columns.

Fix and Benefit:
The size of the search window has now been increased to allow you to search for a job and view all the columns available within the search window.

2. Principal service code displayed on cover sheet

What was the issue:
When downloading the DA Out document, only the ISS service code was displayed next to the general comments, making it difficult for you to link comments against service lines.

Fix and Benefit:
The principal service code will now be displayed next to the general comments section on the DA Out document. This will make it easier to map which general comment is related to which service.

Resolved defects

1. Error displayed when trying to query a service line for the second time

What was the issue:
If a service line has been queried once, when you are trying to query the same service a second time it would show an error.

Fix and Benefit:
This has now been resolved, and you will now be able to query the same service again with no errors.
